Introduction

This document provides information about the Recipe WEB Server program, how to install and use it.

Overview

The Recipe WEB Server is a node.js application that provides a WEB based solution for managing recipes. It supports the following operations:

- Create Recipe
- Edit Recipe
- View Recipe
- Print Recipe
- Delete Recipe

Recipe data is stored in the form of XML files, independent of its presentation.

Features

- Recipe categories are defined by Cuisine and Course
- Recipes have a list of Prerequisites, Ingredients, Steps and Variations
- Ingredients have a Quantity, Unit of Measure, Preparation, and optional Notes
- Steps have a Description and optional Photo
- Recipes may be scaled
- Units of Measure may be changed
- Prep and Shopping lists may be generated
- A printable view is provided, with a means to generate a PDF file
- Static page support is provided for uploading PDF files
- Import/Export of all recipes is supported

Installation

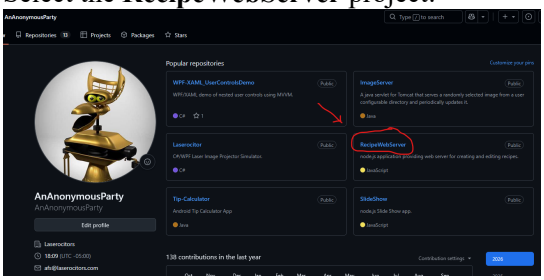

System Requirements

- Required
  - PC running Windows 10 or later
- Optional
  - An API key from Cloudmersive

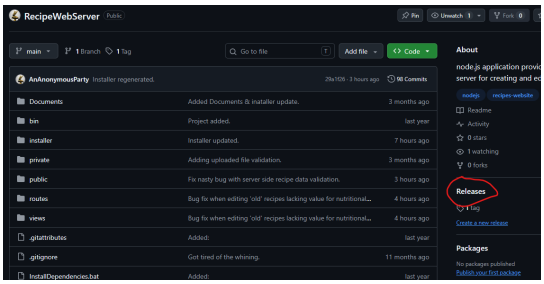

Installation procedure

A standalone installer has been created. The installer will install the server program, node.js, any required dependencies.

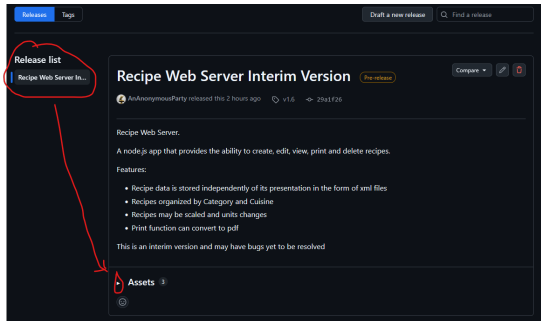

1. Obtain Installer:
   1. Using your favorite WEB browser, go to: github.
   2. Select the **RecipeWebServer** project:

   3. Select **Releases**:

   4. Select the desired release from the **Releases** list and click the ▶ icon next to the **Assets** button to expand the list:

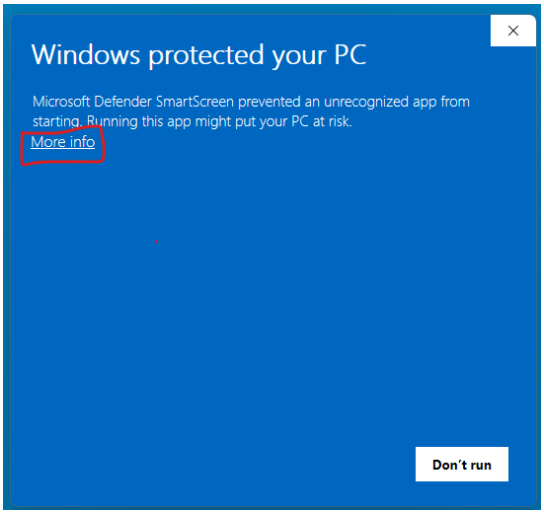

5. Click **RecipeWebServerInstaller.exe** to download the installer:

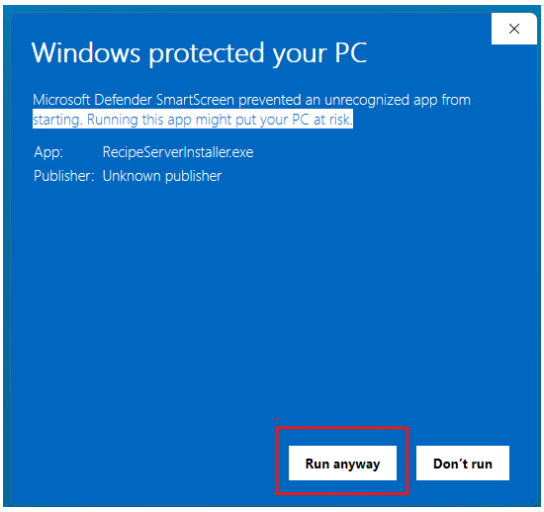

2. Start the installation:
    1. Once the download is complete, open the download directory and double-click **RecipeWebServerInstaller.exe** to begin the installation:

The application is unsigned (meaning I'm too cheap to pay money to register the program with Microsoft) and windows *may* object:

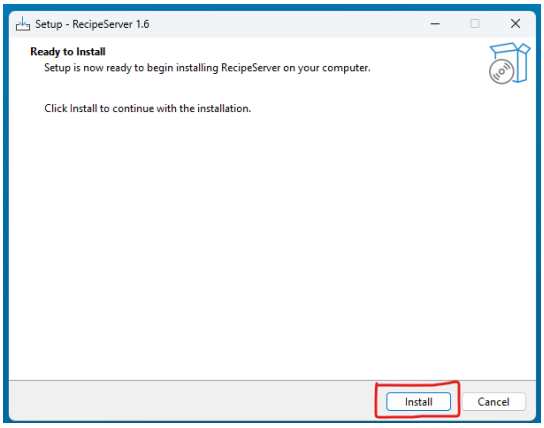

Click the **More Info** link:

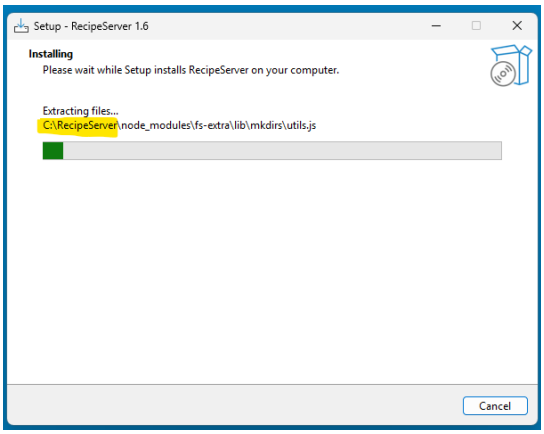

Click the **Run anyway** button.

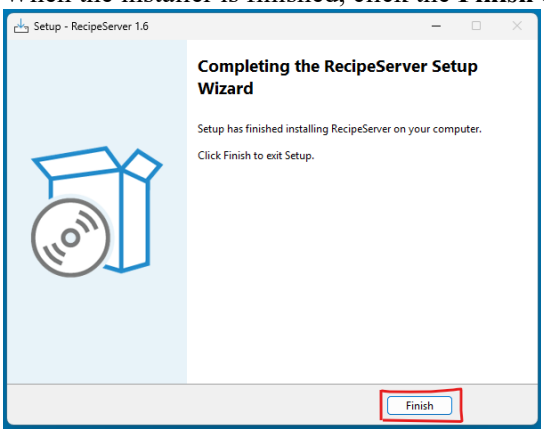

1. Complete the installation:
    1. Click the **Install** button:

2. Note the directory path highlighted in yellow as the installer copies files. This is where the program will be installed:

3. When the installer is finished, click the **Finish** button:

Optional Installation Tasks

Cloudmersive API Key

The Recipe WEB Server allows users to upload images and documents; however, this poses a potential security risk if these files were to contain malicious content. Consequently, the program uses a third party file virus scanning library from Cloudmersive, which requires an API key for access.

Cloudmersive offers a free tier which operates with the following restrictions:

- Maximum calls per month: 800
- Maximum file size per call: 3MB

The key can be obtained simply by creating a free account via registering an email address and then generating/

downloading the key here.

The key is then stored in a text file named `cloudmersiveAPKKey.txt` and then placed in the directory: *server root*`\RecipeServer\private\APIKeys\`.

I Don't Want To Do All That

That's OK, I didn't want to either, but the world is populated with far too many assholes who take delight in making all our lives more difficult.

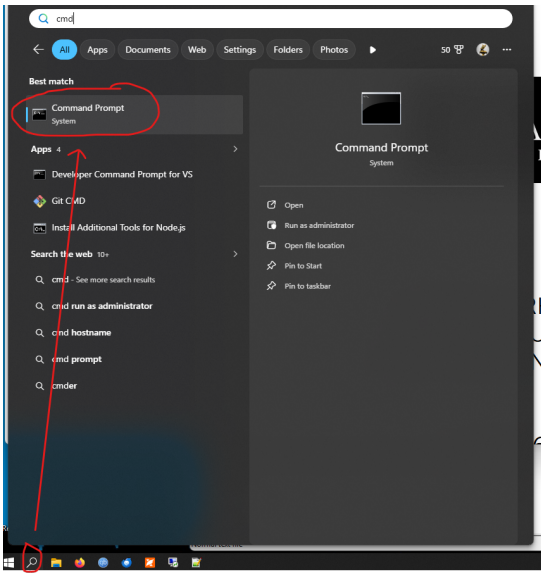

You can disable/enble virus checking via the **Settings** page.

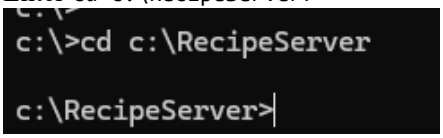

Disabling file virus checking is not recommended on any server that is accessible via a public network.

Starting The Server

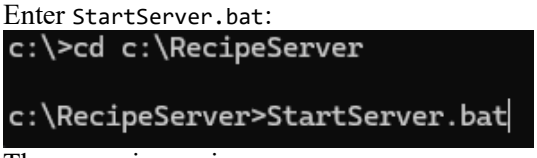

1. Open a Command Prompt:
    1. Click the Windows Search Icon and enter `cmd` in the search box, then select **Command Prompt**:

    2. Enter `cd c:\RecipeServer`:

    3. Enter `StartServer.bat`:

    4. The server is running.

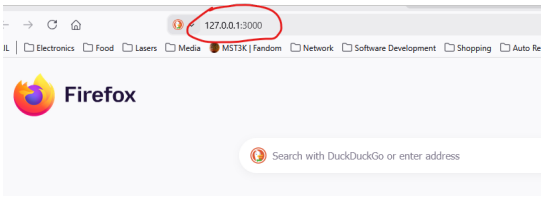

```
Some issues need review, and may require choosing
a different dependency.

Run `npm audit` for details.

> recipeserver@0.0.0 start
> node ./bin/www

  recipeserver:server Listening on port 3000 +0ms
```

5. Using your favorite WEB browser (Firefox, of course), Enter `127.0.0.1:3000` in the search/address box:

Viola!

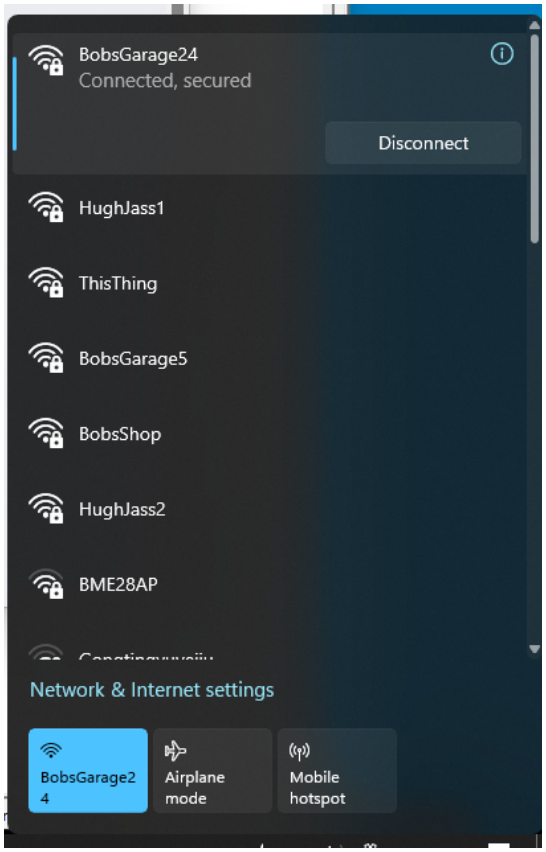

Since the program is a WEB server, it can be accessed by any computer on the same local network by connecting to the IP address of the computer running the server, ex: *nnn.nnn.nnn.nnn*:3000, where *nnn.nnn.nnn.nnn* is the address of the computer where the server is running.

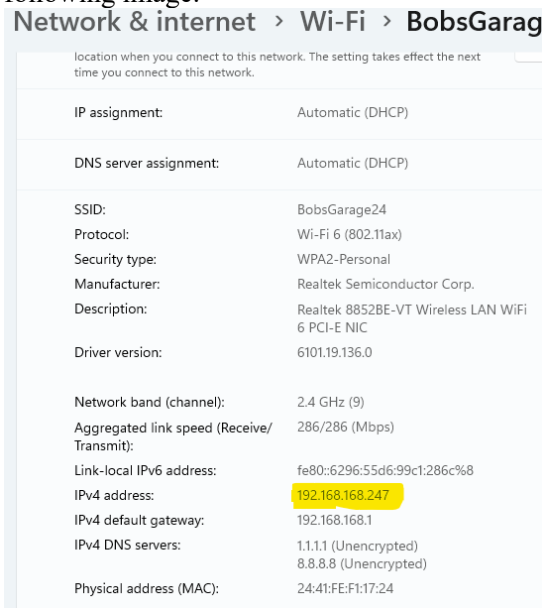

What's *my* IP Address?

To find your IP Address, do the following:

1. Click the network icon in the Windows Task Bar and click the info icon for the network to which you are connected:

2. In the info page that appears, scroll down to find you IPV4 Address as highlighted in the following image:

IP Addresses are typically dynamically assigned by routers when a device connects to the network, so be sure to verify the correct address when the server is started.

Stopping The Server

Simply close the command prompt window.

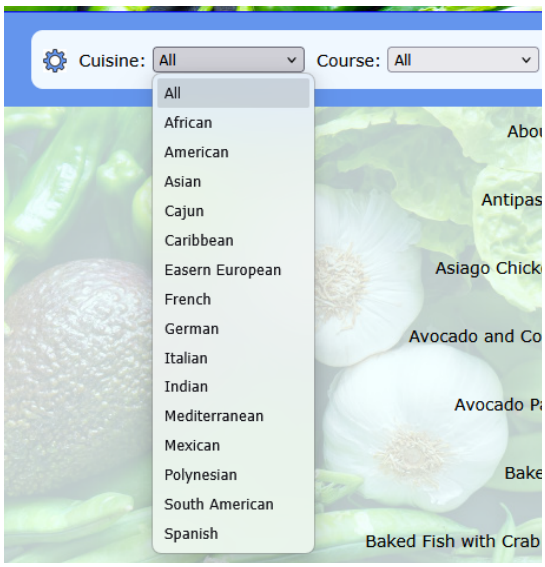

User Guide

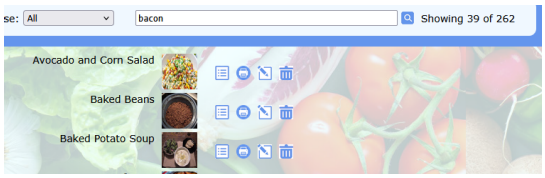

Viewing A Recipe

When accessing the server, a list of all the recipes (except those flagged with a Course Category of Element, Knowledge or Technique) is presented.

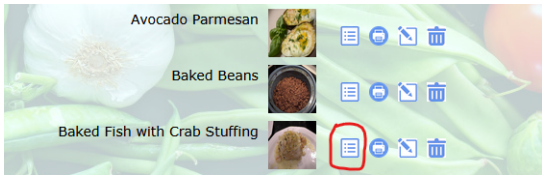

Changing Cuisine or Course categories will refresh to list to show only recipes in those categories:

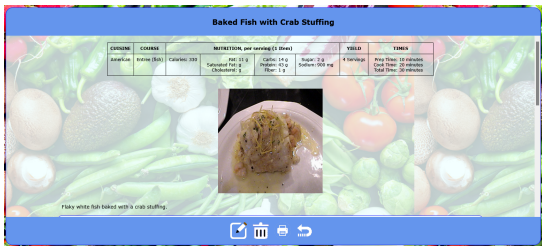

The search box will perform a keyword search for recipes which contain the search term:

To view a recipe, click its associated **View** button:

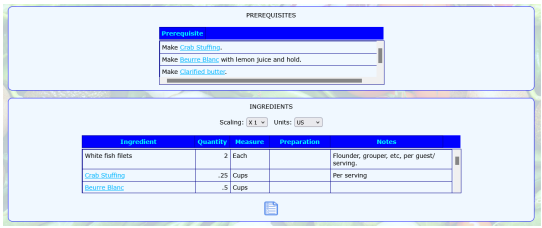

The Recipe is displayed:

Nutrition information, photo of the finished product and a short description is displayed.

Prerequisites and Ingredients

Prerequsites are optional and are intended for things like:

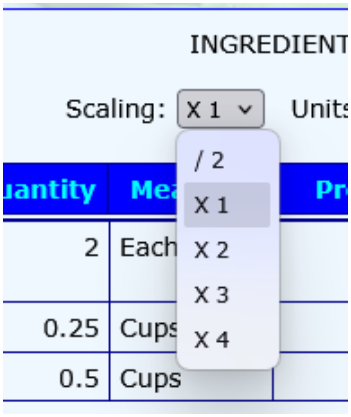

- Preheating an oven
- Making a marinade or something the recipe may require.
- Killing and butchering an elephant

Ingredients are required, otherwise what would the point of the recipe even be?

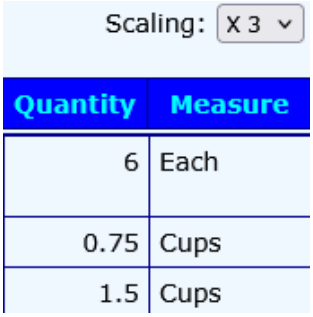

Links to other recipes and external websites may be provided.

Scaling a Recipe

In the ingredients section, choose a scaling value from the provided drop-down list:

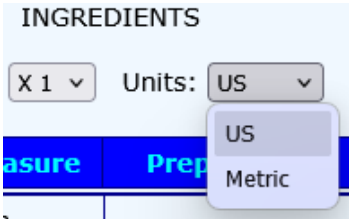

The recipe measurement quantities are automatically scaled:

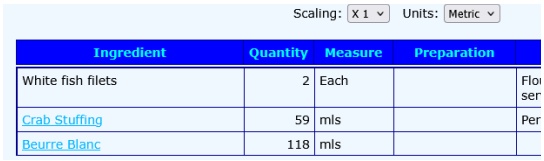

Scaling selections are applied when printing recipes or producing PDF versions.

Changing Units of Measure

To change the Units of Measure, select the unit type from the provided drop-down list:

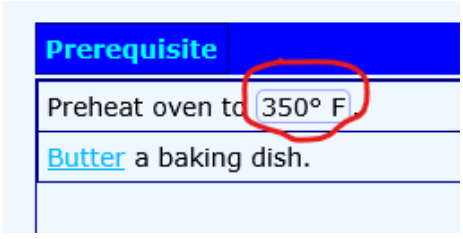

The recipe is automatically updated:

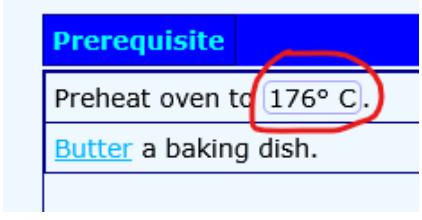

Units of Measurement selections are applied when printing recipes or producing PDF versions.

Changing Temperatures

If a temperature is entered using the special markup delimiters, %%350%%, then it can be toggled between Celsius and Fahrenheit in the recipe view:

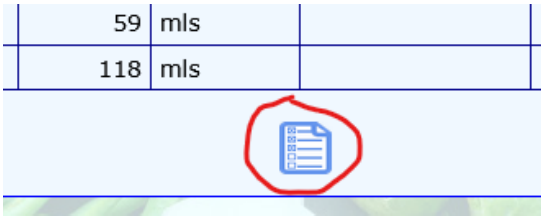

Simply click the temperature value to change the units:

Creating a Shopping List

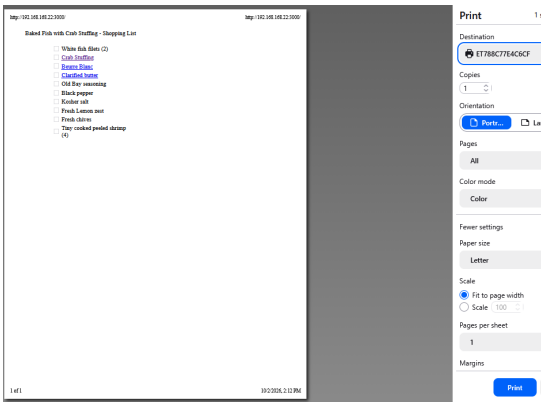

Click the **Shopping List** button:

A shopping list is created:

Click the **Print** button to print it:

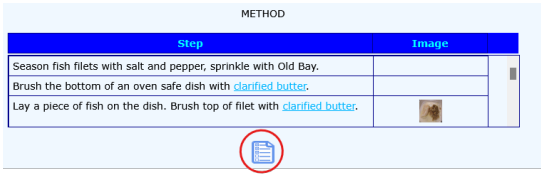

Steps and Variations

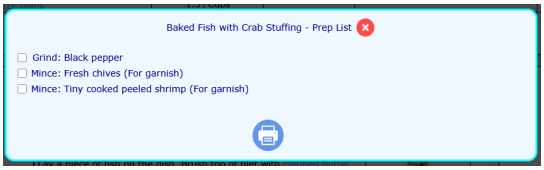

Steps are the actual tasks that need to be performed to make whatever the thing is anyway.

Variations are optional to provide options for folks that can't just go with the flow.

Creating a Prep List

Click the **Prep List** button to display a Prep List, if you are into the whole mise en place thing:

Exiting the Recipe View

To return to the Recipes List, click the **Back** button:

To print the recipe, click the **Print** button:

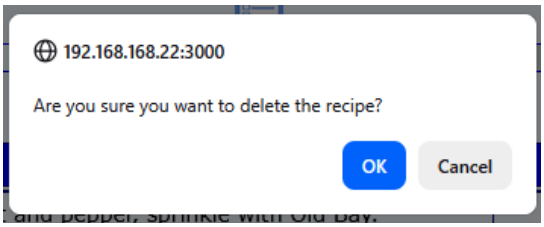

To edit the recipe, click the **Print** button:

To delete the recipe, click the **Delete** button:

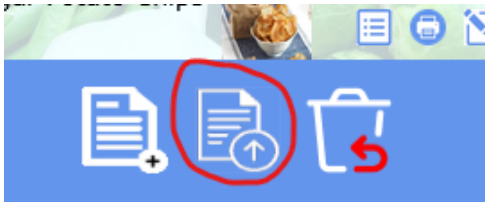

And answer the chicken test:

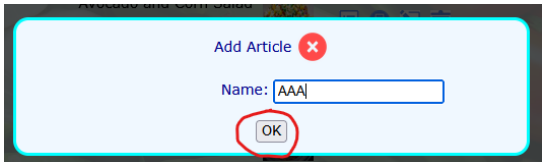

Creating an Article

An Article is just a container for a PDF file. Articles are intended for non-recipe information; for example, describing a technique, information about an ingredient, tables of information, you know, the kind of fluff that is usually included in otherwise useful recipes typically found on the internet.

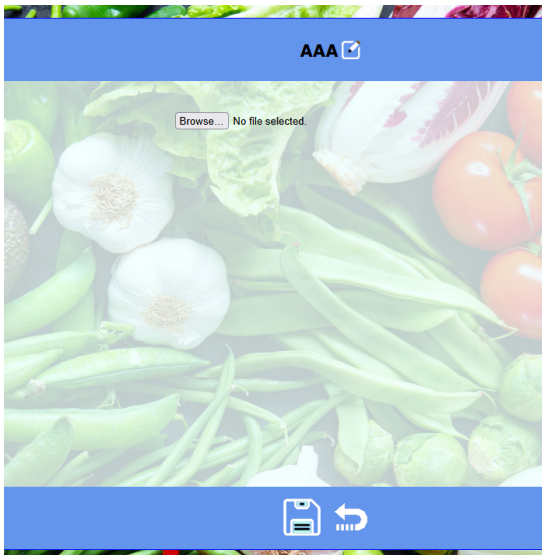

To create an article, click the **Add Article** button on the main screen:

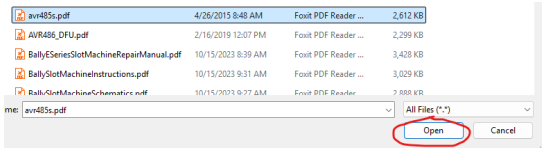

A pop-up will appear. Enter a name for the article and click the **OK** button:

The New Article view will be displayed:

Click the **Browse** button to open a File Browser. Select the PDF file to be uploaded and click the **Open** button:

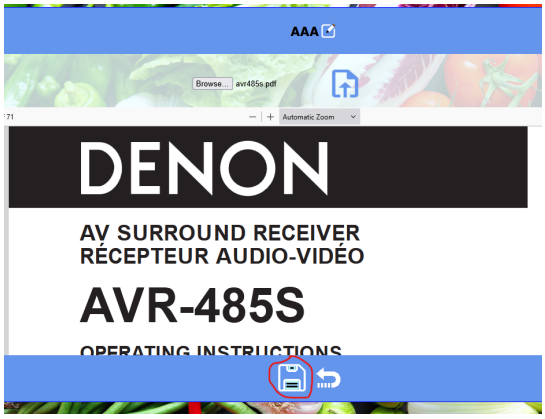

Click the **Upload** button to initiate the file upload:

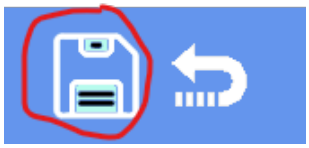

A progress spinner will be displayed while the file is uploading. Status messages will be displayed in the Upload popup.

Uploaded files are scanned for viruses and/or malicious content and my be rejected if deemed suspicious. Uploaded files are limited to 3MB in size.

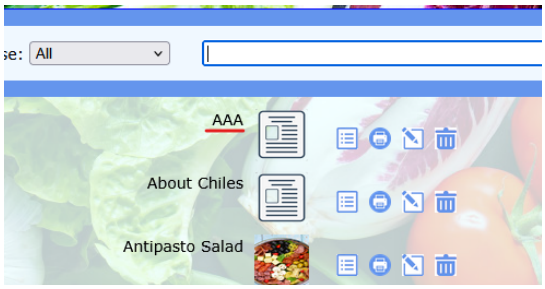

One the file is uploaded, the page will be updated with the file content:

Click the **Save** button at the bottom of the page to save the article"

The article is saved and will appear in the main recipes list:

Creating a Recipe

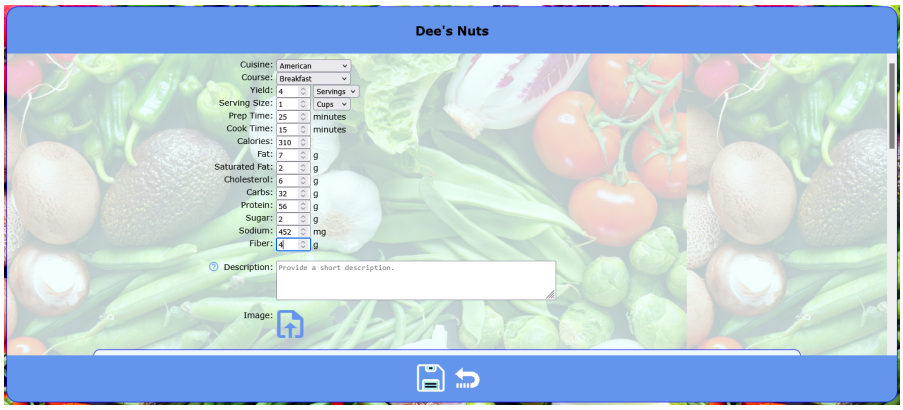

To create a recipe, click the **Add Recipe** button on the main screen:

A pop-up will appear. Enter a name for the recipe and click the **OK** button:

The New Recipe view will be displayed:

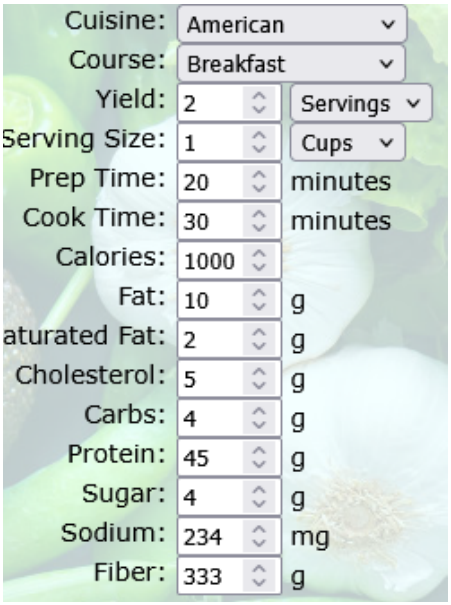

Select a Cuisine and Course type from the provided drop-down lists, if desired.

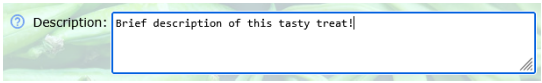

Basic Information

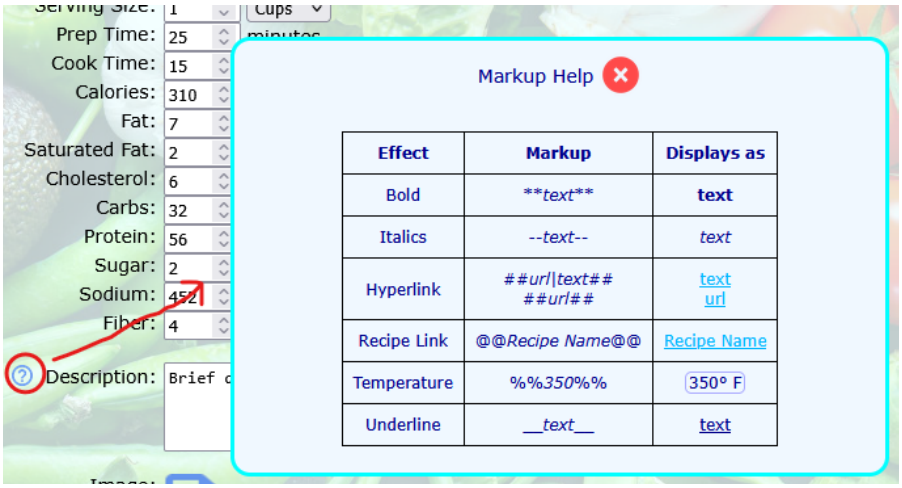

Enter Yield, Time, Serving and Nutrition information:

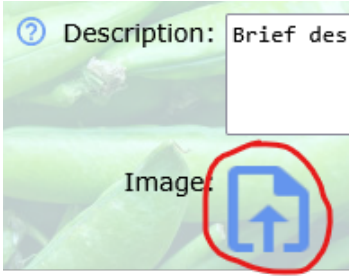

Enter some descriptive text for the recipe. Don't write a fucking book. Nobody needs nor wants a twelve page dissertation about the history of scones when all they are looking for is a biscuit recipe -that's what Wikipedia is for, or consider creating an Article instead.

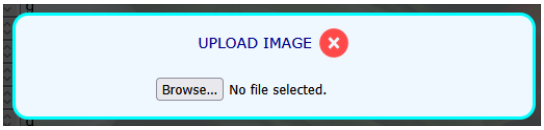

When text fields have the Information Icon next to the field heading, the field supports special markup that can be used to control how the text is displayed and create links. Clicking the icon will display a help popup that describes the markup options:

Upload an image of the finished product by clicking the image **Upload** button:

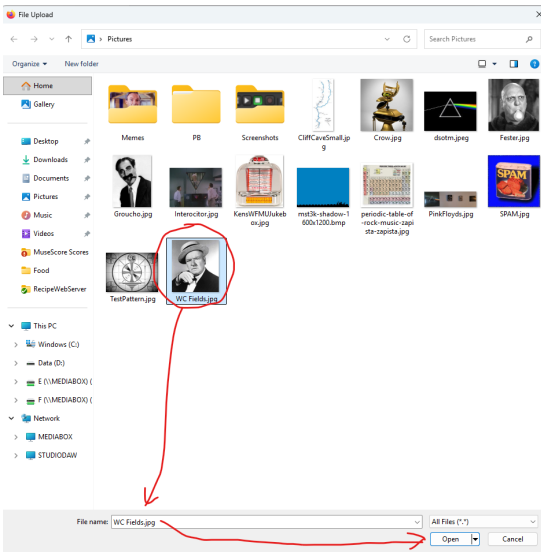

The Image Upload popup will be displayed:

Click the **Browse** button to open a file selector.

Select an image, which will be displayed in the Recipe View page, and in the main recipes list. Pick a pleasing image of the mouthwatering offering and click the **Open** button:

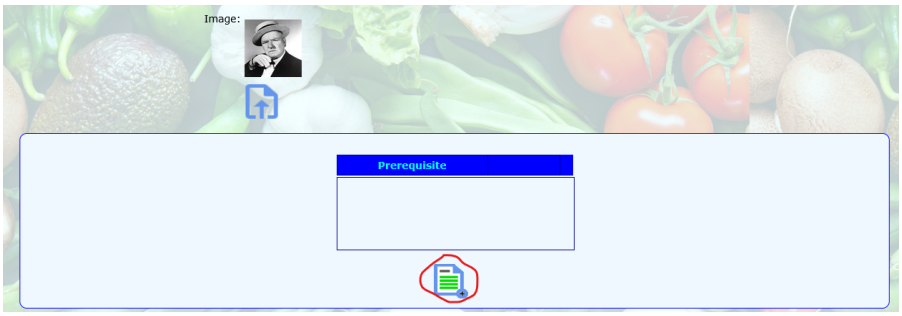

Click the **Upload** button.

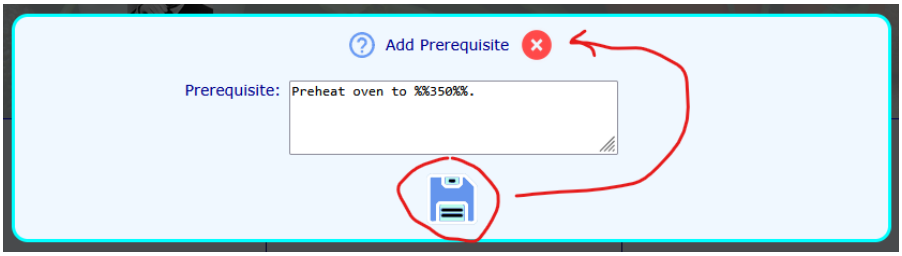

Upload progress and any errors will be displayed. Close the popup when the upload is complete.

Prerequisites

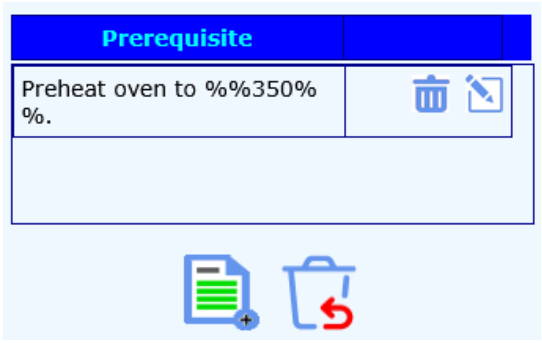

To add Prerequisites, click the **Add Prerequisite** button:

Enter the Prerequiste text, markup is allowed. Click the **Save** button and then close the popup:

The prerequisite has been added:

You can add as many prerequisites as you need. As each one is added, it appears in the list along with some handy (at least, I think so) buttons.

Click the **Edit** button to edit a prerequisite.

Click the **Delete** button to delete the prerequisite.

If you decide all the prerequisites were just a bad idea, click the **Delete All** button below the list to nuke them.

Ingredients

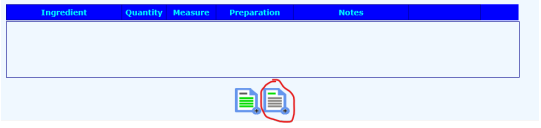

An unlimited number of ingredients may be added.

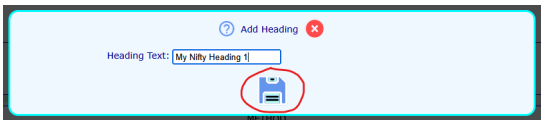

Additionally, plain text headings can be added to help delineate sections of a complex recipe; for example, a cake with frosting, biscuits and gravy, etc.

Heading

To add a heading, click the **Add Ingredient Heading** button:

The Add Ingredient Heading popup will appear. Enter the desired heading text and click the **Save** button:

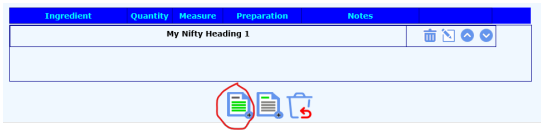

And the Ingredient Heading will be added to the Ingredients List.

Ingredient

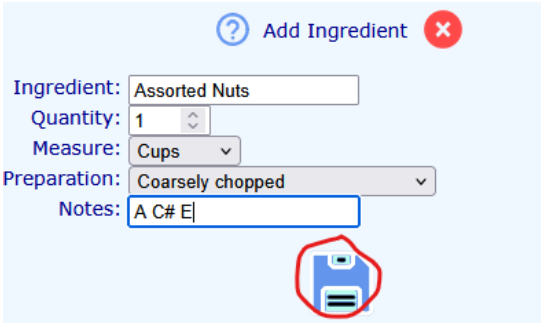

An ingredient has a name, quantity, Unit of Measure, Preparation and optional notes.

To add an ingredient, click the **Add Ingredient** button:

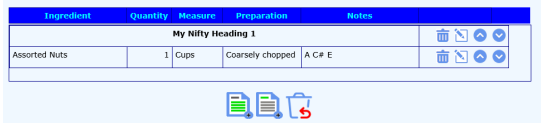

The Add Ingredient popup will appear.

Enter the name of the ingredient, select a Preparation Type, enter the quantity, select a Unit of Measure and enter any notes. Then click the **Save** button:

The ingredient is added to the list:

Fixing Boo-boos

Note the buttons that appear associated with each ingredient/heading.

Click the Up/Down arrow buttons  to move the ingredient/heading in the list.

Click the **Edit** button  to edit the ingredient.

Click the **Delete** button  to delete the ingredient.

Should things go horribly wrong, click the **Delete All** button  to remove all the ingredients.

Steps

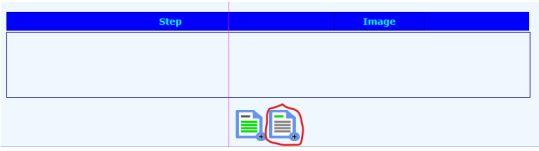

An unlimited number of steps may be added.

Like ingredients, headings may be added.

Heading

To add a heading, click the **Add Step Heading** button:

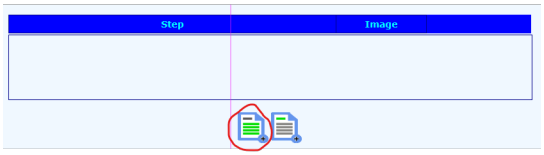

The Add Step Heading popup will appear. Enter the desired heading text and click the **Save** button and the Step Heading will be added to the Steps List.

Step

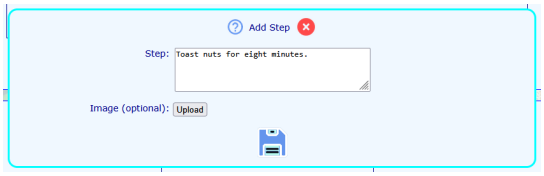

A Step has a description and an optional photo.

To add a step, click the **Add Step** button:

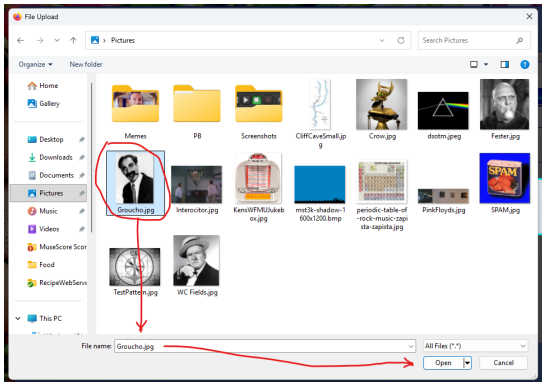

The Add Step popup will appear.

Enter a description. If you want to add a photo for the step, click the **Upload** button. A file upload popup will appear:

Click the **Browse** button:

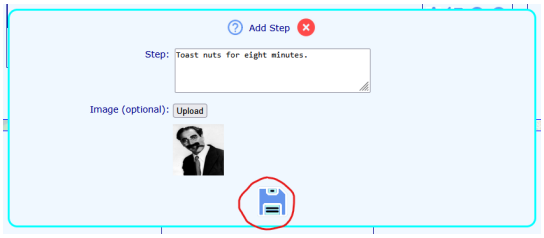

A file browser window will open. Select a file and click the **OK** button:

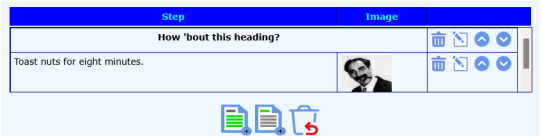

Click the **Upload** button:

Click the **Save** button, and close the popup:

The step is added to the list:

Fixing Boo-boos

Note the buttons that appear associated with each ingredient/heading.

Click the Up/Down arrow buttons  to move the step/heading in the list.

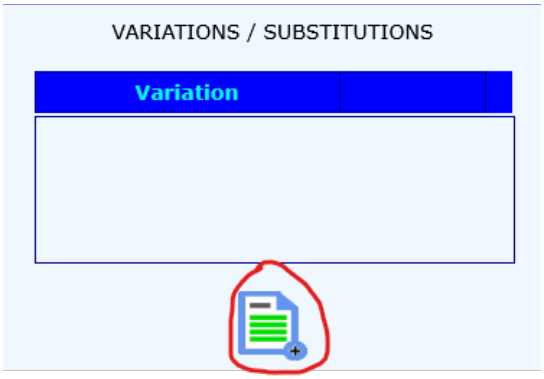

Click the **Edit** button  to edit the step.

Click the **Delete** button  to delete the step.

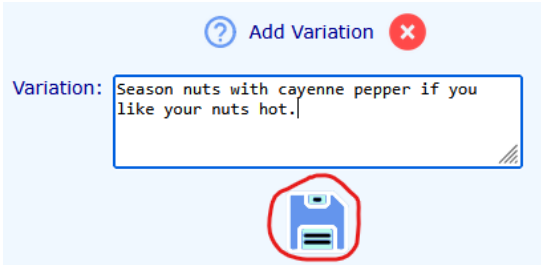

Should things go horribly wrong, click the **Delete All** button  to remove all the steps.

Variations

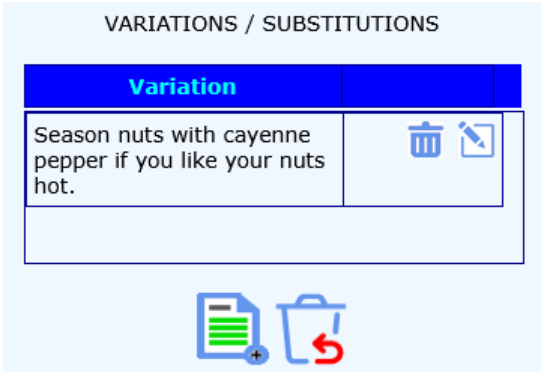

To add Variations, click the **Add Variation** button:

Enter the Variation text, markup is allowed. Click the **Save** button and then close the popup:

The prerequisite has been added:

You can add as many variations as you need. As each one is added, it appears in the list along with some handy (at least, I think so) buttons.

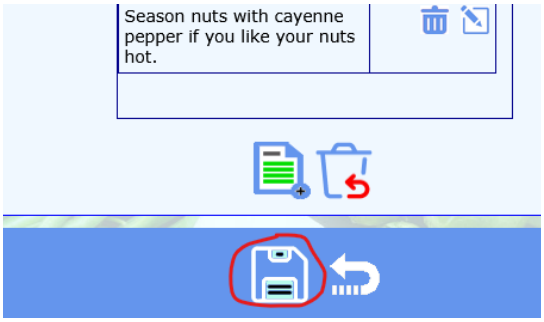

Click the **Edit** button to edit a variation.

Click the **Delete** button to delete the variation.

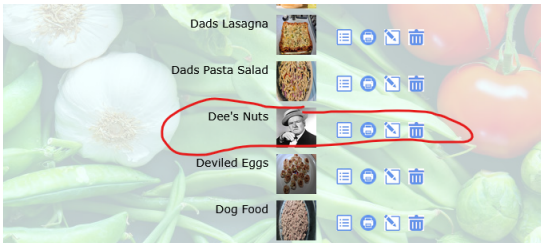

If you decide all the variations were just a bad idea, click the **Delete All** button below the list to nuke them.

Save the new Recipe

To Save the recipe, click the **Save Recipe** button:

The recipe will appear in the Recipes List on the main screen:

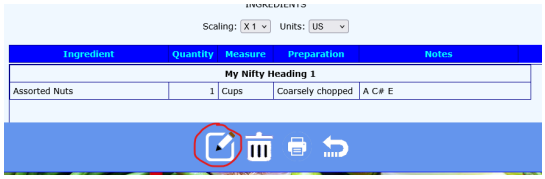

You can view the new recipe:

Editing an Article

Editing an article is essentially the same as creating a article, except that when an article is opened for editing it of course appears with information already provided. The same actions are available for editing as for creating an article, so feel free to refer to the article creation section for details about all of that.

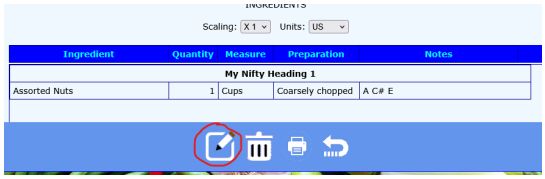

To begin editing a article, click the **Edit** button  associated with it in the Recipes list, or the **Edit** button provided in the Recipe view:

Editing a Recipe

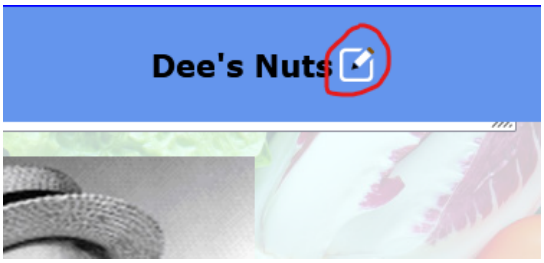

Editing a recipe is essentially the same as creating a recipe, except that when a recipe is opened for editing it of course appears with information already provided. The same actions are available for editing as for creating a recipe, so feel free to refer to the recipe creation section for details about all of that.

To begin editing a recipe, click the **Edit** button  associated with it in the Recipes list, or the **Edit** button provided in the Recipe view:

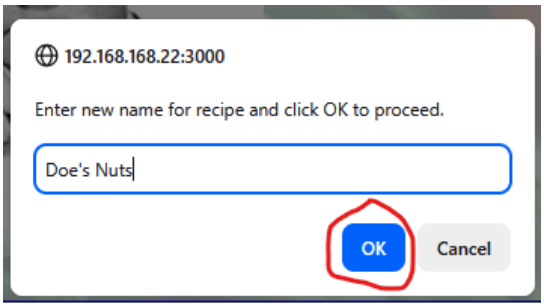

Renaming a Recipe

To rename a recipe, open it for editing and click the **Rename** button at the top of the recipe to the right of its name:

A popup will appear. Enter the new name and click the **OK** button:

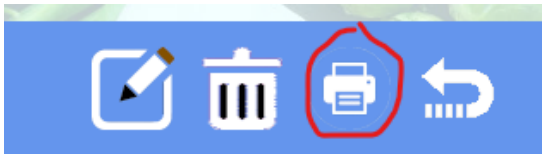

Printing an Article or Recipe

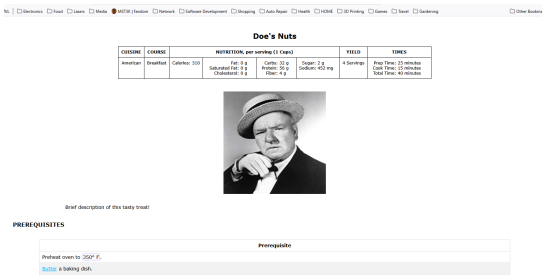

To print an article or recipe, click the **Print** button associated with it in the recipes list:

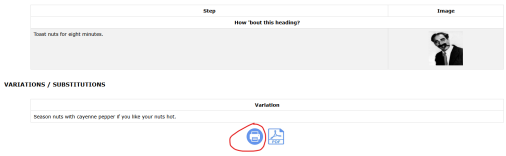

Or click the **Print** button at the bottom of the page when viewing a recipe:

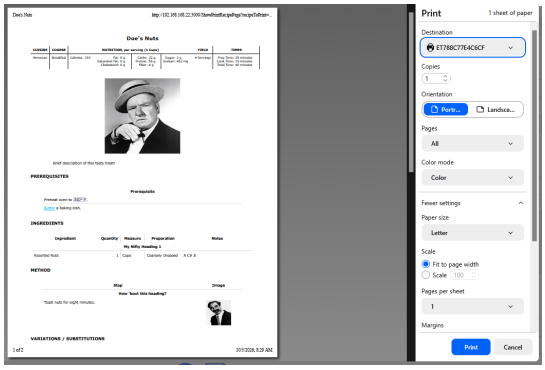

A printable version will be displayed:

Click the **Print** button at the bottom om the page to send it to a printer:

The Windows Print Dialog will open:

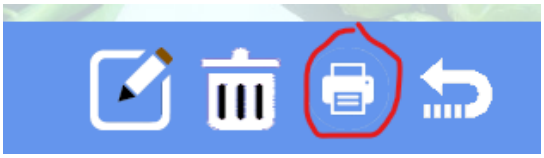

Choose the desired printer and print options and click the **Print** button.

Generating a PDF

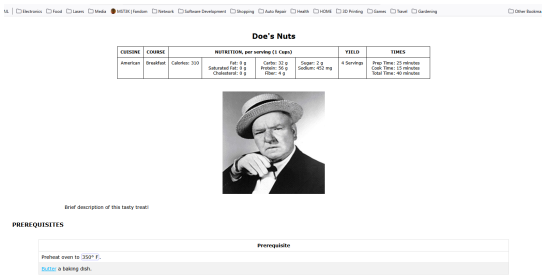

To create a PDF version article or recipe, suitable for framing or emailing, click the **Print** button associated with it in the recipes list:

Or click the **Print** button at the bottom of the page when viewing a recipe:

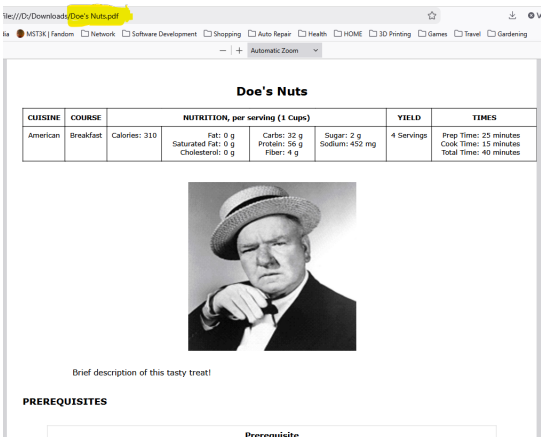

A printable version will be displayed:

Click the **PDF** button at the bottom of the page to send it to a printer:

A PDF file will be generated and sent to a new browser window:

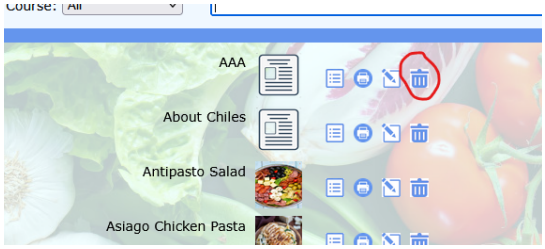

Do with it as you wish, it's not for me to judge.

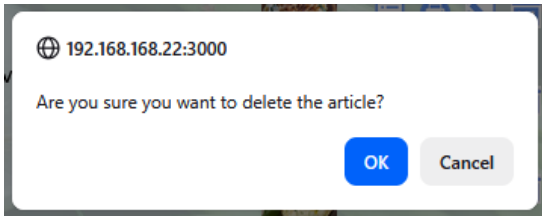

Deleting an Article or Recipe

I get it, we all make mistakes, a chili dog with marshmallow topping may have been a glorious thing in its day, but our tastes change over time. Some things are best left forgotten.

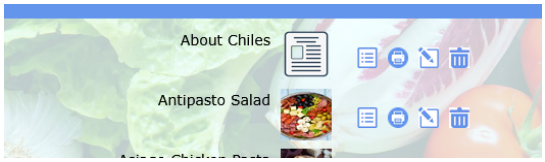

To delete an article or recipe, click the **Delete** button associated with it in the main recipes list:

You get one last chance:

An we shall never speak of it again:

Your secret is safe with me.

Deleting ALL the recipes

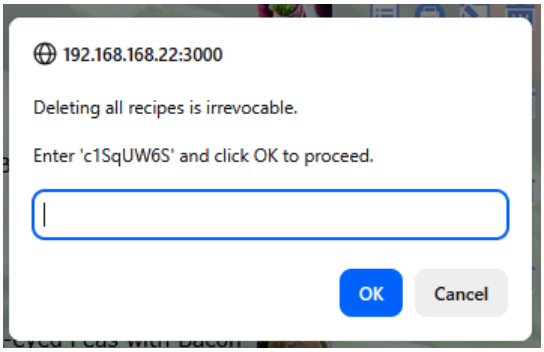

Why do you hate food so much?

To delete all of the recipes, click the **Delete All Recipes** button at the bottom of the main recipes list:

Deleting all the recipes deletes ALL the recipes. Every single one. Forever. There's no turning back, there's no **Undo** button.

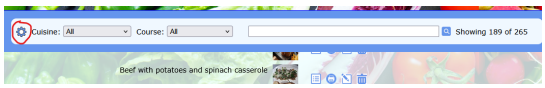

A popup will appear. Enter the code as instructed and click the **OK** button:

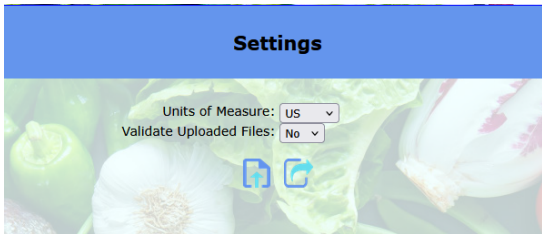

And then it's as if it was all just a bad dream.

Settings

To view the system settings and administrative tasks page, click the **Settings** button on the main page:

The settings page will be displayed:

The following options are available:

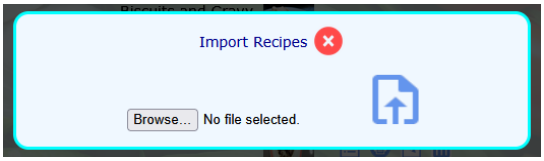

- **Units of Measure**
  Selects the default Units of Measure for recipes
  - US
  - Metric
- **Validate Upload Files**
  Controls whether uploaded files are checked for malicious content (Requires an API key from Cloudmersive).
  - Yes
  - No

Click the **Save** Button to save the settings:

Import

Click the **Import** button to import recipes previously exported or exported from another server:

Click the **Browse** button to open a file browser, select a file, click the **Open** button, and then the **Upload** button.

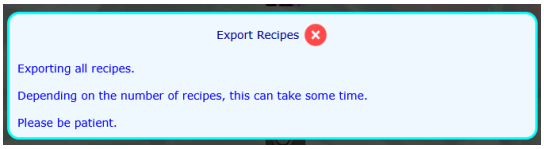

If a recipe is imported whose name is an identical match for an existing recipe, the new recipe will be added with '-2' appended to its name. You can rename the recipe(s) after the import operation has completed.

Export

Click the **Export** button to export one or more, or all recipes:

Click the **Export All** button to export all the recipes in the system:

To export individual recipes, click the checkbox associated with the recipe in the list, ans then click the **Export Selected** button:
